

9. International Suppliers Fair (IZB) in Wolfsburg

Future focus digitalisation & lightweight construction

From 18 - 20 October 2016, more than 49,000 interested professionals had the opportunity to get to know the latest technological developments from 800 exhibiting companies from 32 countries across a surface area of 37,000 m².

There was great interest in our **torsional welding** technology. The [PowerWheel®](#) systems attracted a great deal of attention. We were delighted to receive great feedback from our customers who are already using this technology in **welding aluminium cables** with tubular cable lugs. The latest **eMobility trends in relation to lightweight construction** show that TELSONIC is living up to its pioneering role and offering secure solution concepts to suppliers of on-board power supplies. The MT8000 systems with up to 10 kW of power and MPX HD are the ideal solution here.

Visitors to the trade fair were also interested in our [Telso®Splice](#) ultrasonic welding systems for binding cable braids. The trend for **100% quality production** is supported in combination with the [Telso®Scale](#) measuring tool for maintenance. Leading quality managers from Volkswagen confirmed to us that we offered the right solution for increased requirements.

We thank our customers for their trust in our capabilities and technologies.

Dipl.-Ing. (FH) Rick Steinbach, Metal welding sales, Telsonic GmbH, Germany
