

Telsonic conquers Italy's medical industry

October 2016

Ultrasonic systems for the manufacture of medical inhalers under clean room conditions

Thanks to rigorous safety and hygiene standards, manufacturing systems in the medical industry meet the most stringent requirements. The machines in the background produce medical inhalers under clean room conditions. The plastic parts opening mechanisms are welded quickly and reliably at various points by Telsonic ultrasonic systems.

In this application the challenge was that the inner spring components of the inhaler could not be damaged during the production process. The technicians in the Telsonic laboratory managed to successfully provide a solution for this requirement.
